

Date:

May 2017

Description:

Recovery Point | RHS 8000KG

Application:

Toyota Tacoma 2005+

Part No. :

2823010

Price:

\$259.00

Availability Date:

July 2017

Product Specification

An ARB recovery point for your vehicle can address the issues surrounding OE and generic aftermarket tow points and their unsuitability for a range of recovery situations. ARB's engineers have developed the recovery point to fit in conjunction with standard bumpers and ARB protection bars and to use points within the chassis to achieve a 8,000kg/17,500lbs rating. Four mount points are included per recovery point to ensure that there is no torsional twist on angled pulls.

Each ARB recovery point includes an engineered 'Recovery Train' in which each vehicle specific recovery point is rated for use with a 4.75t rated bow shackle and 8000kg/17,500lbs snatch strap. For peace of mind and safety, ARB recovery points are a reliable solution.

The recovery point has been designed to fit either with the factory front bumper, factory skid plates, ARB bumper and ARB Under Vehicle Protection systems. Other manufacturers bars have not been test fitted and fitment is not recommended with other bars.

FEATURES:

- Constructed from high grade steel and featuring a long slot design for a side-angled pull, the recovery point has been specifically designed for your vehicle.
- Unique, long slot design allows bow shackle to rotate for angled recovery (up to the maximum turn angle of vehicle front wheels).
- Designed to maintain maximum clearance under vehicle and is positioned above the lowest point of your vehicle.
- Recovery eye manufactured from 350 grade 20mm plate for maximum strength and durability.
- Finished in a hard-wearing red powder coat for maximum visibility.
- High tensile bolts.
- Includes all mounting hardware and illustrated instructions.

Research and Design:

Each ARB recovery point undergoes considerable research and design involving actual vehicle chassis samples and CAD data relating to critical front sections of the vehicle.

Dozens of designs are explored, with the more promising models built into prototypes and tested on the actual vehicle chassis using ARB's various load and destructive testing equipment.

Vehicle Specific Mounting :

Some vehicle models demand very complex mounting systems to ensure fitment does not affect air bag deployment in the event of an accident.

ARB's engineers ensure that the crash pulse of the vehicle remains unaffected, while also ensuring the recovery points are fitted in the optimal location to handle the stresses experienced during vehicle recovery.

Rated for Angled Recovery:

ARB recovery points are rated in an angled direction of pull and this has been achieved for angles up to the maximum turn angle of the front wheels of the vehicle.

The design features a long slot as it allows the bow of the shackle to be fed through and the strap attached via the pin instead of the bow. This allows the shackle to pivot within the recovery points to avoid side loads on the pin.
